QUESTION	ANSWER	EXPLANATION	REFERENCE	REMARKS
1. A patient with a long history of chronic kidney disease (CKD) is being evaluated for a kidney transplant. The patient's current creatinine level is 2.5 mg/dL. Which of the following is the most appropriate next step in the evaluation?	Perform a renal biopsy.	In a patient with CKD, a renal biopsy is indicated to determine the underlying cause of the kidney disease and to assess the degree of damage. This information is crucial for determining the patient's eligibility for a kidney transplant.	UpToDate: Kidney Transplantation: Pretransplant Evaluation	
2. A 65-year-old male patient with a long history of hypertension and diabetes mellitus is being evaluated for a kidney transplant. The patient's current creatinine level is 3.0 mg/dL. Which of the following is the most appropriate next step in the evaluation?	Perform a renal biopsy.	In a patient with CKD, a renal biopsy is indicated to determine the underlying cause of the kidney disease and to assess the degree of damage. This information is crucial for determining the patient's eligibility for a kidney transplant.	UpToDate: Kidney Transplantation: Pretransplant Evaluation	
3. A 60-year-old female patient with a long history of hypertension and diabetes mellitus is being evaluated for a kidney transplant. The patient's current creatinine level is 2.8 mg/dL. Which of the following is the most appropriate next step in the evaluation?	Perform a renal biopsy.	In a patient with CKD, a renal biopsy is indicated to determine the underlying cause of the kidney disease and to assess the degree of damage. This information is crucial for determining the patient's eligibility for a kidney transplant.	UpToDate: Kidney Transplantation: Pretransplant Evaluation
